头部位置和放置 - 头部大小

头部的高度或者面部大小（从头顶量起，量到下巴，包括头发，）必须为整个照片尺寸高度的 50% 到 69% 之间。眼睛的高度（从照片底部量起，量到眼镜的水平高度）必须在整个照片高度的 56% 到 69% 之间。

照片像素规格必须按照正方形的比率（即高度与宽度必须一致）。最小尺寸不得小于 600 像素（宽）*600 像素（高）。最大尺寸不得超过 1200 像素（宽）*1200 像素（高）。

HEAD POSITION & PLACEMENT - HEAD SIZE

The **head height** or **facial region size** (measured from the top of the head, including the hair, to the bottom of the chin) must be between 50% and 69% of the image's total height. The **eye height** (measured from the bottom of the image to the level of the eyes) should be between 56% and 69% of the image's height.

Image pixel dimensions must be in a square aspect ratio (meaning the height must be equal to the width). Minimum acceptable dimensions are **600 pixels (width) x 600 pixels (height)**. Maximum acceptable dimensions are **1200 pixels (width) x 1200 pixels (height)**.

亮度，对比度和色彩准则

- 亮度和对比度必须调节到能够准确表现拍摄物。
- 未正确调节过对比度或色彩的照片会导致某些特殊的面部特征模糊不清。
- 色彩必须能真实再现自然肤色。
- 使用未进行色彩平衡校正的荧光灯或其他闪光灯可能导致照片上出现不必要的色偏。
- 适配的滤色镜能减小不当的色彩平衡。

BRIGHTNESS, CONTRAST AND COLOR GUIDELINES

- Brightness and contrast should be adjusted to present the subject and background accurately
- Photos without proper contrast or color may obscure unique facial features
- Color should reproduce natural skin tones
- Fluorescent or other lighting with unbalanced color may cause unwanted color cast in the photo
- Appropriate filters can eliminate improper color balance.

照片样本 - PHOTO EXAMPLES

过深或过浅的服装可能导致自动曝光系统过度补偿，从而拍出过深或者过浅的肤色。可以在拍摄前使用一张中性灰色卡片放在一个稳定高度来设置曝光。

Very dark or very light apparel may cause certain auto-exposure systems to overcompensate, resulting in overly dark or light flesh tones. A neutral gray card may be used to set exposure at a consistent level before placing the subject in the scene.

过高的对比度通常会导致整个画面光影明显。可以通过对拍摄物的散射光调节获取正确的对比度。这时的闪光会在降低整体对比度的同时增加局部的对比度。

Contrast that is too high is usually due to the overall light and shade in the scene. Correct contrast can be achieved by directing diffused lighting onto the subject. Such lighting increases the local contrast while reducing the total contrast.

照片质量受拍摄时使用的闪光类型的影响。应避免使用白炽灯和荧光灯混合在一起的闪光灯。使用正确的滤色镜可以提高整体闪光质量使传统胶卷或数码相机传感器感应到，从而抵消非自然色彩效果。某些高级数码相机可以使用一张中性白色卡片调节白平衡。

Picture is affected by the type of light used. Avoid mixing incandescent and fluorescent lighting. Corrective filters can improve the overall light that reaches the conventional film or digital camera sensor, and thus remove unnatural color effects. A neutral white card may be used to set the white balance level on some advanced digital cameras.

ARTIFACTS – unnatural distortion, defects, noise, or patterns in the image.

ASPECT RATIO – image width divided by image height (x:y).

BACKGROUND – the area behind the subject; it should be smooth, flat, and non-patterned to minimize unwanted reflectance; the background should be plain white or off-white.

BIT – short for binary digit, which, in a computer, is the smallest unit of storage.

BRIGHTNESS – the amount of light and dark areas in an image.

CENTERING – the orientation of the facial region within the frame; head should be positioned such that the approximate horizontal mid-points of the mouth and bridge of nose lie on a vertical line at the horizontal center of the photo width; and a horizontal line through the center of the subject's eyes can be located between 56% and 69% from the vertical bottom of the photo.

COLOR BALANCE – how a camera reproduces the colors of a scene; using the wrong lighting can cause the colors to appear washed out or unnatural.

COLOR CAST – the overall bias towards one color in a color image.

COMPRESSION – the process of encoding an image using fewer bits than an unencoded representation would use through the use of specific encoding scheme; file size reduction by the removal of data determined by an algorithm to be of lesser importance to the content of an image.

COMPRESSION RATIO – quantifies the reduction in data-representation size produced by a data compression algorithm; a representation that compresses a 10MB file to 2MB has a compression ratio of 10/2 = 5, or 5:1.

CONTINUOUS-TONE – refers to an image where like colors in the subject and scene do not change abruptly; the opposite of posterization.

CONTRAST – the range of difference in the light to dark areas of an image.

DOT – the smallest element that can be printed by a digital printer.

ENHANCEMENT – the modification of an image.

EXPOSURE – in photographic terms is the product of the intensity of light and the time the light is allowed to act on the film, or digital camera sensor. In practical terms, the aperture controls intensity or amount of light and shutter speed controls the time.

EYE HEIGHT – the distance from the bottom of a passport or visa photo to a horizontal line going through both eyes; should measure between 56% and 69% of the image's height.

FACIAL FEATURES – the makeup or appearance of a subject's face or its parts, including scars, tattoos, etc.

FACIAL REGION SIZE – the facial region, as measured from the bottom of the chin to the top of the head (including hair), should be between 50% to 69% of the image's height.

FILE SIZE – the size of an image in digital photography, measured in kilobytes (KB), megabytes (MB), or gigabytes (GB). File size is proportional to its pixel dimensions; images with more pixels may produce more detail at a given printed size, but they require more disk space to store and are slower to print.

GRAININESS – the sand-like or granular appearance of an image. Graininess becomes more pronounced with faster film and the degree of enlargement. In digital imaging, graininess may occur as a result of printing an image, the pixel resolution of which is too coarse, or as a result of using a printer with poor dot resolution.

HEAD ORIENTATION – the positioning of the subject's head, specifically positioning the face to the full frontal position, eyes level and open. For those individuals that wear glasses, proper head orientation is crucial in avoiding unwanted glare from glasses. Even so, care should be taken to meet the required facial area and face centering guidelines outlined in this brochure when positioning the subject's head to remove the potential glare.

JFIF – JPEG File Interchange Format, image file format standard.

JPEG – Joint Photographic Experts Group, a common method of compression in photographic images.

LIGHTING ARRANGEMENT – the lighting arrangement for subject illumination which should consist of a minimum of 3 point balanced illumination; two (2) points of illumination should be placed at approximately 45 degrees on either side of the subject's face, the third point should be placed so as to illuminate the background uniformly.

NATURAL EXPRESSION - The subject's expression should be natural, with both eyes open. Please refer to the photographs found on this website for acceptable facial expressions.

OVER-EXPOSURE - refers to a condition where too much light reaches the film or digital camera sensor, either because it is too bright or has been applied too long, resulting in a very light photograph.

PIXEL - short for picture element; a single picture element of a digital photo or displayed image. Taken together, all of the millions of pixels form a grid that represents the content of the image.

PIXELIZATION - the graininess in an image that results when the pixels are too big, relative to the size of the image.

POSTERIZATION - the effect produced when a photographic image is displayed or printed with too few colors or shades of gray; the opposite of continuous-tone.

PPI - short for pixels per inch; the measurement of resolution for displaying or printing digital images.

PRINT - refers to an exposed film picture that is printed on photographic paper, in color or black and white. In digital imaging, a print is the result of printing the digital image on photographic-quality paper stock using a digital printer. For passport/visa photographs, the resulting print should measure 2 inches x 2 inches (51 mm x 51 mm).

RESOLUTION - refers to a measure of the detail that can be seen in an image; the higher the resolution, the finer the detail that can be seen.

RETOUCHING – the alteration of a printed photograph using tools such as an airbrush.

SAMPLING FREQUENCY – the number of samples (e.g., pixels) per unit (e.g., inch).

SHARPNESS - refers to whether an image appears to be in focus.

SRGB - refers to a standard default RGB color space. This is a device-independent color space designed to remove any color-bias from the representation of an image on the specified device.

STRETCHING – Lengthening the image in one dimension (e.g., y) disproportionately to the other dimension (e.g., x).

SUBJECT POSITIONING - the position of the subject with respect to the camera; the subject should be placed in front of the background such that the focal distance from the camera's lens to the subject's face should be no closer than 120 cm.

UNDER-EXPOSURE - refers to a condition where too little light reaches the film or digital camera sensor, either because the light is not sufficient or it hasn't been applied long enough; it results in a very dark photograph.
